

Road Asset Management Systems + Performance-Based Contracting

Session 2.2: Data Analysis and Planning

Serge Cartier van Dissel February 2020

Day 1	Day 2	Day 3
Road Asset Management System	Road Asset Management System	Performance Based Contracting
(RAMS)	(RAMS)	(PBC)
Session 1.1	Session 2.1	Session 3.1
Introduction to RAMS	Data processing and	Introduction to PBCs
	management	
Coffee break	Coffee break	Coffee break
Session 1.2	Session 2.2	Session 3.2
Functions of a RAMS	Data analysis	Performance standards
	and planning	
Lunch	Lunch	Lunch
Session 1.3	Session 2.3	Session 3.3
Data to be collected	Road asset management	Inspections and Payments
Coffee break	Coffee break	Coffee break
Session 1.4	Session 2.4	Session 3.4
Method of data collection	Conclusions and way	Conclusions and way
	forward	forward

Analysis and Planning

- Determine current treatment needs
 - Based on road conditions
- Predict future road conditions and treatment needs
 - Based on road deterioration modelling
- Prioritize budget allocations to different roads/treatments
 - Based on prioritization criteria optimize results
 - Based on available budget

Prioritization Criteria

- Different criteria used
- Economic benefits most commonly used
 - Benefit/cost ratio
 - NPV of the net benefits divided by NPV of the treatment costs
 - Strongly influenced by traffic volumes (road user costs)
- Sometimes complemented by other criteria
 - Connectivity connecting administrative centres, airports/ports, border crossings
 - Economic productivity connecting industrial, agricultural, tourism areas
 - Population connecting densely populated areas, large populations
 - Social inclusion connecting poor areas, remote areas

Economic benefits

- 3 main concepts
- Deterioration and maintenance
 - Roads gradually deteriorate depending on traffic, climate, topography, design, etc.
 - Different maintenance types have different effects on road conditions
- Total transport costs
 - Agency costs of carrying out maintenance and rehabilitation
 - Road user costs as a result of road conditions
- Influence of traffic
 - More traffic causes quicker deterioration
 - More traffic results in higher road user costs

Deterioration and Maintenance

- Deterioration left unaddressed reduced lifespan
- Costly rehabilitation needed
- Average road condition poor

Deterioration and Maintenance

- Condition improved before it becomes poor
- Periodic maintenance less costly (but more frequent)
- Average road condition fair

Deterioration and Maintenance

- Deterioration slowed down through annual routine maintenance
- Low additional cost, but high cost savings

Total Transport Costs

Economic benefits

- We can model the condition of different roads over time
 - Depending on characteristics (design, traffic, climate, topography, etc.)
 - Depending on the maintenance treatments and their timing
- We can calculate the total transport costs
 - Costs of planned treatments and their timing
 - Road user costs
 - Depending on resulting road conditions
 - Depending on traffic volumes
- We can compare costs to benefits
 - Net present value of costs of treatments during planning period
 - Net present value of savings to total transport costs during planning period
 - NPV savings/costs compared to base scenario (do nothing)
 - Road/treatment combination with highest NPV/investment gets highest priority

- High volume road in poor condition
 - Costs: Rehabilitation NPV is \$5.0 million
 - Benefits: Reduced total transport costs NPV is \$8.0 million
 - Benefits/Costs (NPV/CAP): 1.6
- Low volume road in poor condition
 - Costs: Rehabilitation NPV is \$5.0 million
 - Benefits: Reduced total transport costs NPV is \$6.0 million
 - Benefits/Costs (NPV/CAP): 1.2
- High volume road in fair condition
 - Costs: Periodic maintenance NPV is \$0.5 million
 - Benefits: Reduced total transport costs NPV is \$1.0 million
 - Benefits/Costs (NPV/CAP): 2.0
- Low volume road in fair condition
 - Costs: Periodic maintenance NPV is \$0.5 million
 - Benefits: Reduced total transport costs NPV is \$0.8 million
 - Benefits/Costs (NPV/CAP): 1.6

Strategy Analysis

- Simplification of road network into road cases
 - Reduced data requirements (IQL 3 IQL 4)
 - Each case represents total length of road segments with those characteristics

Strategy Analysis

- Can be used to prepare a decision matrix for selection of treatments
 - Based on expected budget
 - Based on optimum use of that budget
- Can be used as basis for further planning
 - Integrated into RAMS

RAMS analysis and planning

- Results of the RAMS analysis are the basis for planning
 - They are not necessarily the end result
- Combination of treatments into suitable packages
 - Avoiding very short treatment lengths
 - Creating more unified treatment approaches
- Combine economic criteria with other criteria
 - Use of other criteria will result in some changes to the ranking and selection
 - Changes should be limited to avoid much lower efficiency of investments

Example: Georgia

- HDM4 results for basis for planning
- Other criteria also applied
 - Difficulties getting objective data
- Final plan 80% in line with HDM4 results

Rehabilitation of:

Sh37 Sadakhlo-Tsopi-Askhepi secondary road km3-km8 Section

Project Description

Following road section is part of rolling program for year 2018, section connects international road S07 Marneuli-Sadakhlo to Armenia border and provides access to social services to more than 1500 people. Road is considered importan in terms of Agriculture as well as providing minimum standard of mobility and integration.

Utilization		Class	Economic Indicators (mln. Gel) / Road Works									
Traffic (AADT)	250	1	Total Capital Cost	3.0	Pavement structure	n/a						
Heavy Vehicles (%)	2.5	1	NPV	0.14	Bridge/Culvert/structure	n/a						
¹ Condition	10.91	4	NPV/Cost Ratio	0.03	Traffic Safety	n/a						
² Population Density	227	4	Cost/Pop. Ratio	0.002	Environment	n/a						
Socio Economic Impact Assesment												
Objective	Indicator											
Enhanced National Connectivity	Part of Secondary Road connecting two international roads.											
Enhanced Regional Connectivity	Distance from the centre of section to closest city centre.											
Enhanced economic activities	Number of registered businesses in the district where the section is located.											
Population	Number of people living within 2km buffer along the road section.											
Education	Number of schools within 2 km buffer along the road section.											
Tourism	Number of attraction within 2 km buffer along the road section.											
Poverty	Percentage of people receiving government support within district where road section is located.											
Life Line Road	The road is the only possibility for connecting the village to outside world.											

Project Area Map

¹Description of Condition Classes (Good, Fair; poor and Bad) is found in Chapter 4, section 1.1

Integrated or Separate

- The analysis/planning can be integrated or separate from the RAMS
- Separate (e.g. HDM4, dTIMS)
 - Data is exported from RAMS and imported into pavement management system (PMS)
 - PMS is used to carry out analysis
 - Results are exported from PMS and imported into RAMS
 - Results can be adjusted using other criteria (e.g. multicriteria analysis)
 - Results are shown in the RAMS (tables/maps)
- Integrated
 - RAMS includes planning module often simplified (e.g. decision matrix)
 - Analysis is carried out using RAMS data
 - Results can be adjusted using other criteria (e.g. multicriteria analysis)
 - Results are shown in the RAMS (tables/maps)

Example: Uzbekistan

- Started using HDM4
 - Complicated to use
 - No Russian language option
- Included programming module in Russian-language database
 - Based on results from HDM4 strategy analysis
 - Data can still be exported in HDM4 format

- HDM4 Strategy Analysis to determine optimal treatments
 - Depending on traffic volume and road condition
- Basis for planning module in RAMS
 - RM: Routine maintenance
 - CS: Crack Sealing
 - PAT: Patching
 - LR: Local Repair
 - EB: Edge Break Repair
 - REP: Reprofiling
 - SBST: single surface dressing
 - DBST: double surface dressing
 - AC0x: x cm asphalt concrete overlay
 - MROx: x cm milling + replacing of asphalt
 - AC13: asphalt surface and base overlay
 - RECY: recycling of asphalt layers
 - RECO: reconstruction

Group Work

- What prioritization criteria should we use?
 - Economic
 - Other
- How should different criteria be combined?
- Should the analysis be detailed or basic?
- Should the analysis function be integrated or separate?
